July 10, 1978

School of Industrial and Systems Engineering
Georgia Institute of Technology

E-24-664

1.0 INTRODUCTION

This report is a status summary of activities performed on the internship project entitled "Development of an Interactive School Boundary Analysis Model." This project is considered the first phase in the implementation of a school boundary analysis model for Clayton County Schools.

The original elements of this project include:

- 1) Code Development Activities - Assistance in the design of an interactive code for use by School District Managers.
- 2) Data Analysis Activities - Assistance in the definitions of appropriate analysis of the various data elements as to accuracy and precision.
- 3) Code Validation Designs - Assistance in the determination of a process for validating the outputs of the interactive code.

2.0 ACTIVITIES

The tasks undertaken in this first phase include parcel definition, data manipulation, programming logic, and output structure. The result of these tasks is to be an interactive computer model to determine present student distribution and to project school populations under various boundary configurations. Each task is reviewed including both progress attained and unresolved problems encountered. All tasks were undertaken knowing the ultimate goal is to be a comprehensive model using the Atlanta Regional Commission street network file as its base.

2.1 Parcel Definition

The basic physical unit examined by the model is that of a parcel. Each parcel is a geographic unit bounded by natural features such as

streets, rivers, and utility rights-of-way as well as artificial features such as present school boundaries and lot lines. The task of defining the initial set of parcels using both objective and subjective criteria resulted in partitioning Clayton County into approximately 250 parcels. Initially the county was partitioned using all existing school boundaries. These parcels were then subdivided using natural and artificial features. Finally these parcels were subdivided using knowledge of neighborhood structure and traffic patterns of the county. Each parcel was given a unique number whose digits indicate a general location in the county. This initial set of parcels will be further partitioned using the initial student distribution as well as input from administrators. Since new sets of parcels are expected to evolve with each use of the model, the processes for parcel definition and numbering are flexible.

2.2 Data Manipulation

Creation of parcels caused the creation of new data files to describe the parcels and the revision of existing data files for use in obtaining desired results. The task was undertaken with the goals of reducing redundancy in data as well as correcting any existing errors in the data files. Initially the existing STREET2 file is appended with data as to the location of streets related to parcels. Each street which is contained in a single parcel is assigned the unique parcel number. Each street previously assigned a 99-999 district-land lot code in the STREET2 file and each multi-parcel street is assigned a code of 9999. A data file STREXT is under development to locate each segment of these streets to a unique parcel. This process is complicated by the characteristics of house numbers in Clayton County. Most problems can be resolved by actually visiting

streets in question although the zero base line in the County prevents unique assignment of some street segments.

2.3 Program Logic

The task of determining the logic of programs to be used in both data manipulation and location of student population has been accomplished. Programs are needed to record collected data into proper files as well as to determine the parcel location of each student. These programs should be written and implemented as a natural progression toward implementing the model. Further program logic needs depend upon the type of software available for use by the administrator. Batch operation of the model requires different programs than on-line terminal utilization.

2.4 Output

The task of determining output is being focused on statistics of student distribution and statistics of school populations under present boundaries as well as projected school populations. A summary of statistics for the student distribution will yield grade level, sex, and race distribution countywide through parcel totals. Furthermore each parcel will be looked at in detail at the request of the user to find student distribution by street and house number. Summary statistics of school populations categorized by grade, sex, and race will be available under present boundary conditions. Projections over short planning horizons will be made assuming no movement of student populations as a tool for the user. Use of long planning horizons would appear to require development of improved projection capacity. Furthermore by changing the assignment of parcels to different schools these statistics will yield projected

enrollment under varying school boundary configurations.

3.0 CONCLUSION

The tasks have progressed to the point where the question of mode of operation, remote batch or on-line terminals, needs to be answered. Furthermore, the parcel definitions will need to be reviewed and refined before the initial phase can be used. The utilization of a distance measure for determining approximate travel distance from home to school has not been resolved at the present time. The development or lack thereof, of the street file by the Atlanta Regional Commission is a factor to be considered in both the distance measure and further development of the model.

Thus, several specific questions require resolution prior to project completion. These are:

- 1) Is it feasible for the mode of operation to be by an interactive terminal from the Board of Education building or will the operation be restricted to remote batch mode?
- 2) If the interactive terminal mode is feasible, is it possible to rent or buy a portable terminal with hard copy capability?
- 3) Should further data development depend upon the completion of a street network data file by the Atlanta Regional Commission?
- 4) Would the Clayton County Schools be willing to assist the Atlanta Regional Commission's completion of the street network through data collection and data verification?

E 24-664

FINAL REPORT

CLAYTON COUNTY SCHOOLS

Development of an Interactive School Boundary Analysis Model

INTRODUCTION

This report is the summary of activities performed and results obtained on the internship project entitled "Development of an Interactive School Boundary Analysis Model."

The original elements of this project include:

- 1) Code Development Activities - Assistance in the design of an interactive code for use by School District Managers.
- 2) Data Analysis Activities - Assistance in the definition of appropriate analyses of the various data elements as to accuracy and precision.
- 3) Code Validation Designs - Assistance in the determination of a process for validating the outputs of the interactive code.

The general outline of this report begins with a brief explanation of the model and its functions. Programming logic with flowcharts is followed by proposed output format of the system. Data analysis is discussed with some data results presented in the Appendices. Finally, after a brief description of code validation ideas, recommendations for further development of the model and the decision-support system are presented.

MODEL

The initial goal of a comprehensive interactive system for analysis of school boundaries and facility utilization has been delayed due to lack of development of the data base in the form of a complete street network file by the Atlanta Regional Commission. The direction taken in the internship moved to that of a system for more immediate use in analyzing boundaries while keeping the final goal of a comprehensive decision support system feasible for the future. Furthermore, the lack of terminals meant that the

planned capability for an interactive mode of operation had to change. Batch operation became the only alternative.

The model utilizes data on student locations in the county to produce certain school attendance figures corresponding to the specified school boundaries. Tentative boundaries are specified by the user. The model depends upon the master student file, the street file, and the parcel file. Through sorting procedures, the attendance at each school is projected under the assumption of homogeneous student movement through grade levels. Student migration in and out of a geographic region yields a stable student distribution under this assumption. Through the batch mode, summary statistics are output under various boundary configurations and projections proposed by the decision maker.

The following data files are referenced in the remainder of this report.

STREET2 - This file contains the street code, street name, district-land lot, and parcel number of each street in the county;

MSF - The Master Student File contains information on each student in the county including name, address, present grade, present school assignment, race and sex;

STREXT - A data file containing house numbers and parcel numbers for each street in the county which crosses parcel boundary lines;

PARCEL - Contains present or proposed school assignment of students in each parcel by grade.

Computer codes need to be developed to implement the batch system. The following computer programs are proposed to construct the desired output:

1) ADD - a program to add raw data on streets to STREET2

Purpose: Add PARCEL codes to STREET2 file.

Input: Keypunched PARCEL and SCODE records from Appendix I.

Output: Revised STREET2 file.

Logic: Read diskette and add PARCEL code to matching SCODE record on STREET2 file. PARCEL code is a five digit number from 00000 to 09999.

2) BUILD - a program to place raw data on multi-parcel streets in the STREET file

Purpose: Build a file of streets which cross boundary lines including the largest house number appearing in a specific parcel. These streets are identified by a 9999 PARCEL code.

Input: Keypunched STREXT records on diskettes from Appendix II.

Output: STREXT file.

Logic: Read diskettes and load on file.

3) BOUND

Purpose: Build or revise PARCEL file containing assignments of parcels to schools.

Input: Keypunched records or diskettes dictated by user consisting of SCH school code and PARCEL code.

Output: PARCEL file

Logic: Read diskette and either

i) change SCH school code on matching PARCEL code in PARCEL file.

ii) add SCH school code and PARCEL code record if no match.

Output: Revised PARCEL file.

- 4) GROUP - a program to match a student's present address to a unique parcel

Purpose: Match student address to unique parcel containing that location and tabulate information.

Input: STREET2, STREXT, and MSF files.

Output: Intermediate data file to be used in ASSIGN program.

Logic: Sequentially search records in MSF file for match of address to PARCEL code. Once match is found add 1 to appropriate totals for that PARCEL code number. If no match, then print record for error detection. Read a record in MSF sequentially.

A) Match address street code to code in STREET2 file.

1) If no match, print address, name, school assignment for error detection.

2) If there is a hit and PARCEL code is not 9999 then add appropriate street code and tabulations necessary for output to a location indexed by PARCEL code.

3) If there is a hit and PARCEL code is 9999 then locate street code in STREXT.

a) Match record to parcel code by comparing house number of student to HSNUM in file as follows:

i) If student house number lies between consecutive HSNUM labels in file, the unique parcel number is that

associated with last HSNUM.

- ii) If student house number is greater than last HSNUM, then print record for error detection.

5) ASSIGN - a program to interpret boundary configurations for output

Purpose: Manipulate output file of GROUP and data file PARCEL to give summary statistics for batch output.

Input: Output of GROUP and data file PARCEL.

Output: Summary statistics for user.

Logic: Using output formats as guides, add appropriate subtotals to yield three types of output:

SUMMARY

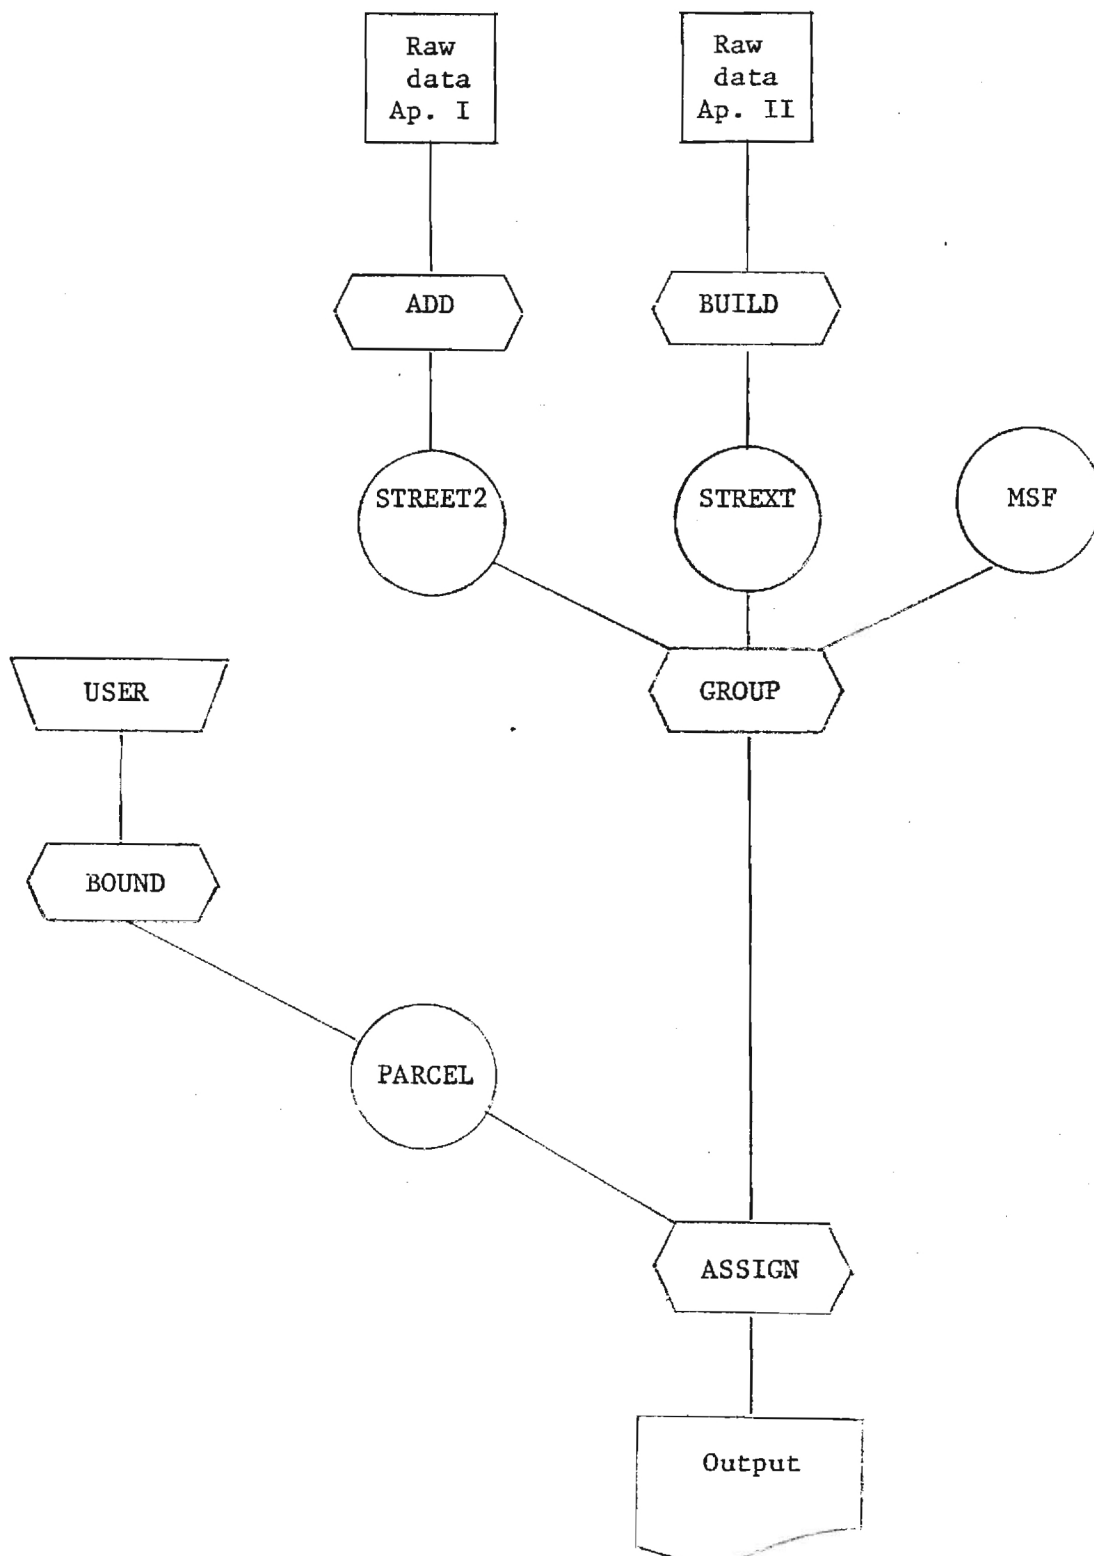

SCHOOL INDEX

PARCEL INDEX

One year projections are obtained by simply adding 1 to grade designation output from GROUP and rerunning ASSIGN.

Details of programming, as per agreements, are left for the computer center to accomplish. A systems model is presented in Figure 1 to display the logic of interaction of these computer codes and data files. The output format is displayed in Figures 2, 3 and 4.

The user can manipulate the model by assigning different combinations of parcels to schools thereby in effect varying school boundaries and observing effects on student populations at various schools as reported in the data outputs.

DATA ANALYSIS

The data analysis depends upon the definition of parcels. The task of defining the initial set of parcels using both objective and subjective criteria resulted in partitioning Clayton County into approximately 250 parcels. Initially the county was partitioned using all existing school boundaries. These parcels were then subdivided using natural and artificial features. A map overleaf showing these parcels appropriately scaled to the School System maps, has been prepared and is to be delivered to Clayton County Schools separate from this report. This configuration was reviewed and approved by the administration where each parcel was given a unique number whose digits indicate a general location in the county. Since new sets of parcels are expected to evolve with each use of the model, the numbering system allows each parcel to be subdivided up to 10 times.

During the process of creating the data files assigning streets and portions of streets to parcels, the data information contained in the Appendices was gathered.

Appendix I consists of a listing of all streets in the county with its unique parcel number added in the last column. A street with an asterisk * has a parcel code of 9999. Those streets with a question mark "?" could not be located on a map and are further detailed in the listing of Appendix IV. This data is to be used with program ADD to revise the STREET 2 file. The STREET 2 file will then have a record as follows:

Field Position	Field Label	Picture	Description
1 - 3	School Code	9(3)	SCH
4 - 6	Street Code	X(3)	SCODE

7 - 22	Street Name	X(16)	STREET
23 - 24	District	99	DIST
25 - 27	Land Lot	9(3)	LLOT
28 - 32	Parcel Code	9(5)	PARCEL

Appendix II consists of a raw data file of those streets which cross parcel boundaries and have a parcel code of 9999. This data is to be used in building the STREXT file. The ODD-EVEN code is used as follows: i) 0 indicates both sides of street are included in parcels listed

ii) 1 indicates that only odd house numbers are included in parcels listed

iii) 2 indicates that only even house numbers are included in parcels listed.

There will be two records for streets not having a 0 code. The raw data yields a list of all parcels in which portions of the street are included and the largest house number in each specific parcel.

The STREXT file will be as follows:

Field Position	Field Label	Picture	Description
1 - 3	Street code	9(3)	SCODE
4	Odd-even label	9	OELAB
5 - 10	Largest House Number	9(6)	HSNUM
11 - 15	Parcel number	9(5)	PARCEL
16 - 21	Largest House Number	9(6)	HSNUM
22 - 26	Parcel number	9(5)	PARCEL

-ETC.-

This record should be long enough to include most streets without having to create 2 or more records for the same side of the street.

Appendix III contains discrepancies found in the STREET 2 file which should be analyzed and changed to improve validity of data.

Appendix IV contains a listing of streets which can not be located on street maps of Clayton County either due to lack of real

existence of such streets or discrepancies in the maps. These should be taken up with the Clayton County Planning Department to ascertain these locations if they exist.

Great care has been taken to avoid error in collection of raw data in order to minimize problems with data validity after implementation. This process slows gathering of data but should avoid problems. Development of the street network file by the ARC will greatly ease manipulation of data but will still require careful observation of accuracy and data maintenance procedures.

VALIDITY TESTING

After the files have been computerized and programs debugged there may still be validity problems due to both errors in MSF and typographical and data gathering errors in other files. By listing student addresses for streets in STREXT file with actual current school assignments which differ from model assignments, indications of data errors should result.

A comparison between actual school populations and summary statistics with actual boundaries will indicate discrepancies in data files. By looking at the parcel index output for schools with large discrepancies, it should be possible to pinpoint streets which are assigned incorrectly or numbered incorrectly in either STREET 2 or STREXT files.

CONCLUSION

The model output should give the administrator further insight into boundary configurations. By reassigning parcels through the BOUND program, the user can see effects on school populations with various boundary shifts. Using the Parcel Index output, the user

will have a better feeling for student distribution in the county.

Implementation depends upon completion of data gathering as well as the programs being written. Most problems encountered in data manipulation appear to be under control and capable of straightforward solution. The programs and output are outlined in this report as a guide for both computer programmers and data managers to set final specifications for optimal use.

Once this initial phase of implementation is accomplished, further development is recommended. The implementation of the street network file upon completion by the Atlanta Regional Commission will yield many benefits. Among those are:

- 1) Ease of parcel splitting and STREET revision by utilizing computer to perform the data adjustment work;
- 2) Distance measurement capability to enhance the consideration of distances and transportation impacts in boundary decisions;
- 3) Ability to utilize graphical displays of outputs in map-like scales;
- 4) Ability to address bus routing and scheduling problems using the computerized data base.

Furthermore, after the network file is implemented, mathematical models should be developed as outlined in "Analysis of Attendance and Facilities Utilization" using forecasting and operations research techniques to propose optimal long range boundaries to the user. With this powerful tool at his disposal, the administrator can make use of non-intuitive information for further boundary shifts.
